

Version Controls with Git and Tower

How to clone git repository from GitLab to Tower

Step 1. Go to the url link for the Git Projecyor Repository. Forexample, go to Slacks and open the url .

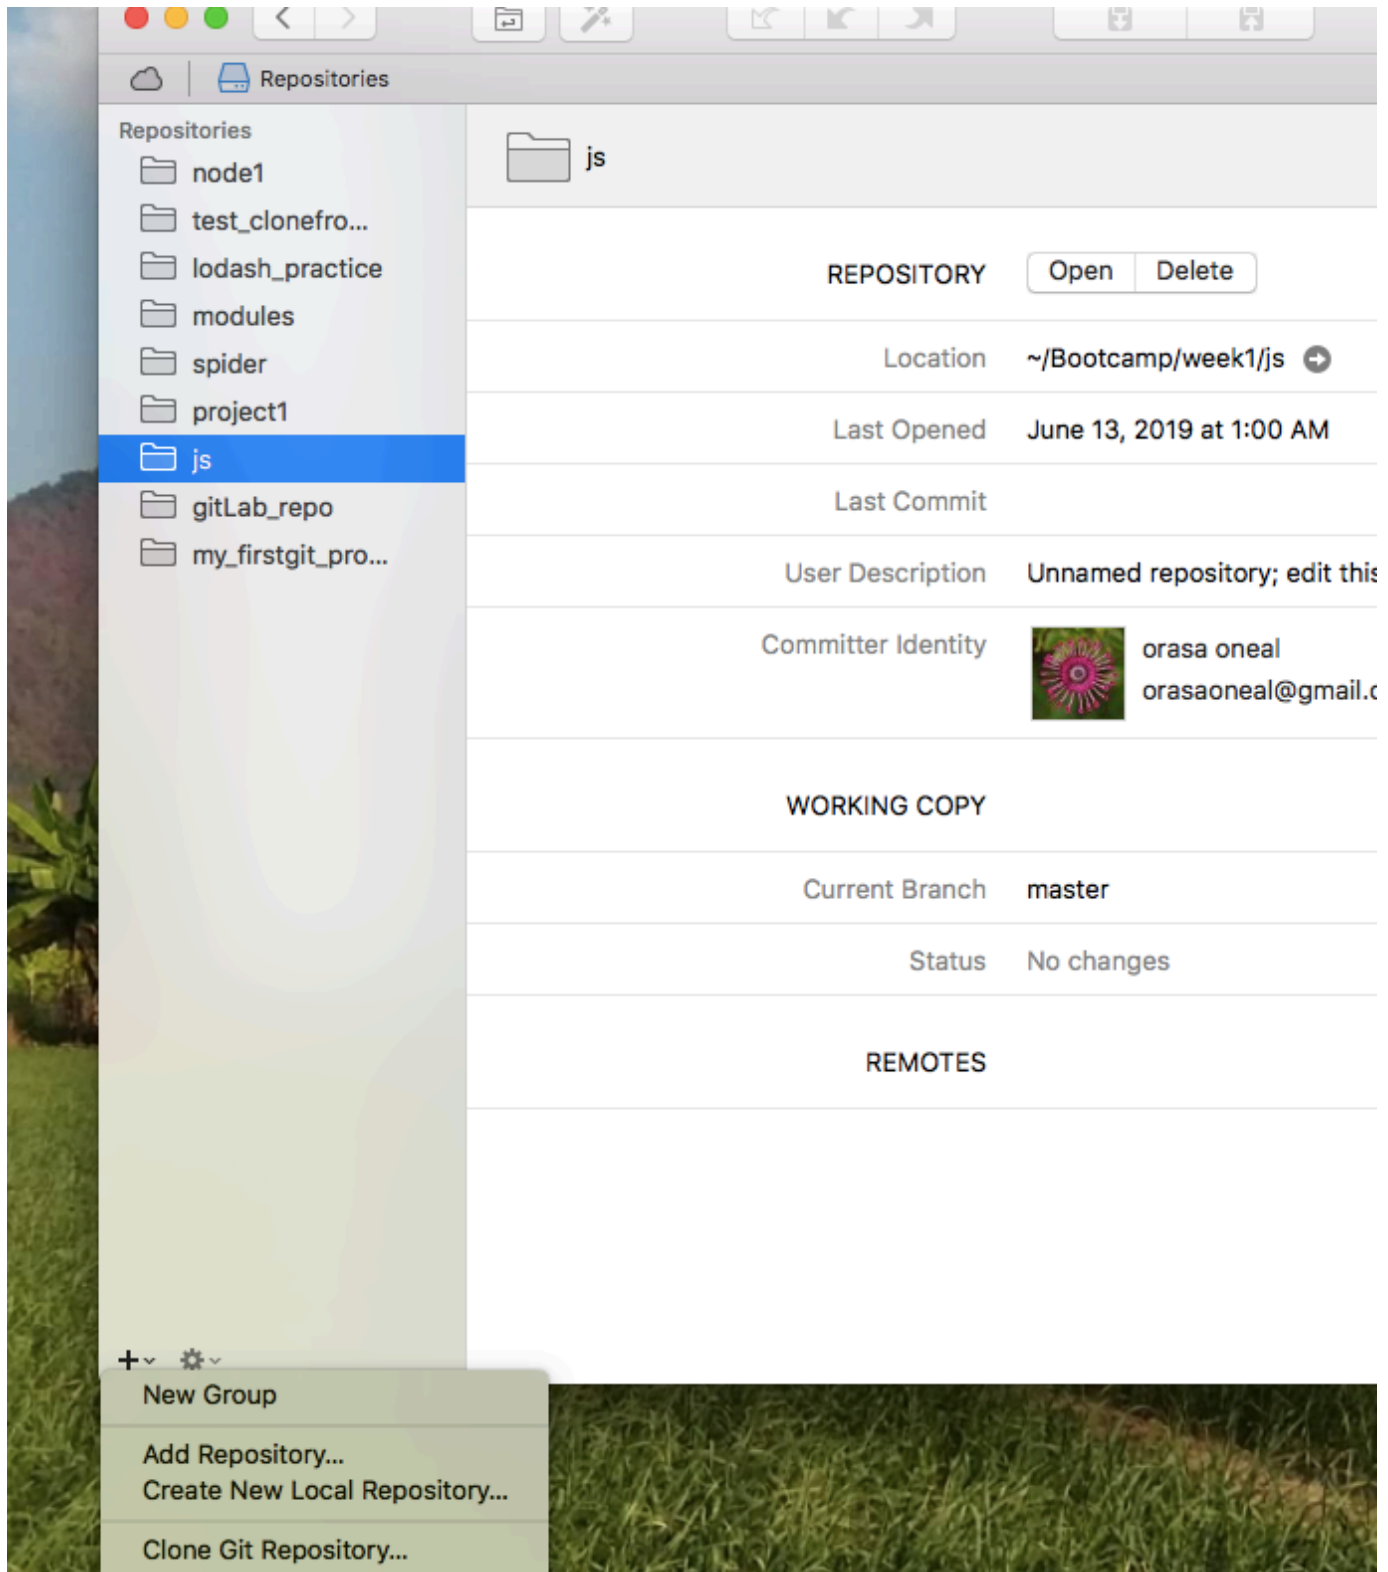

Step 2. Open the link. On the right Corner select the dropdown arrow on clone button. Select Clone with HTTPS.

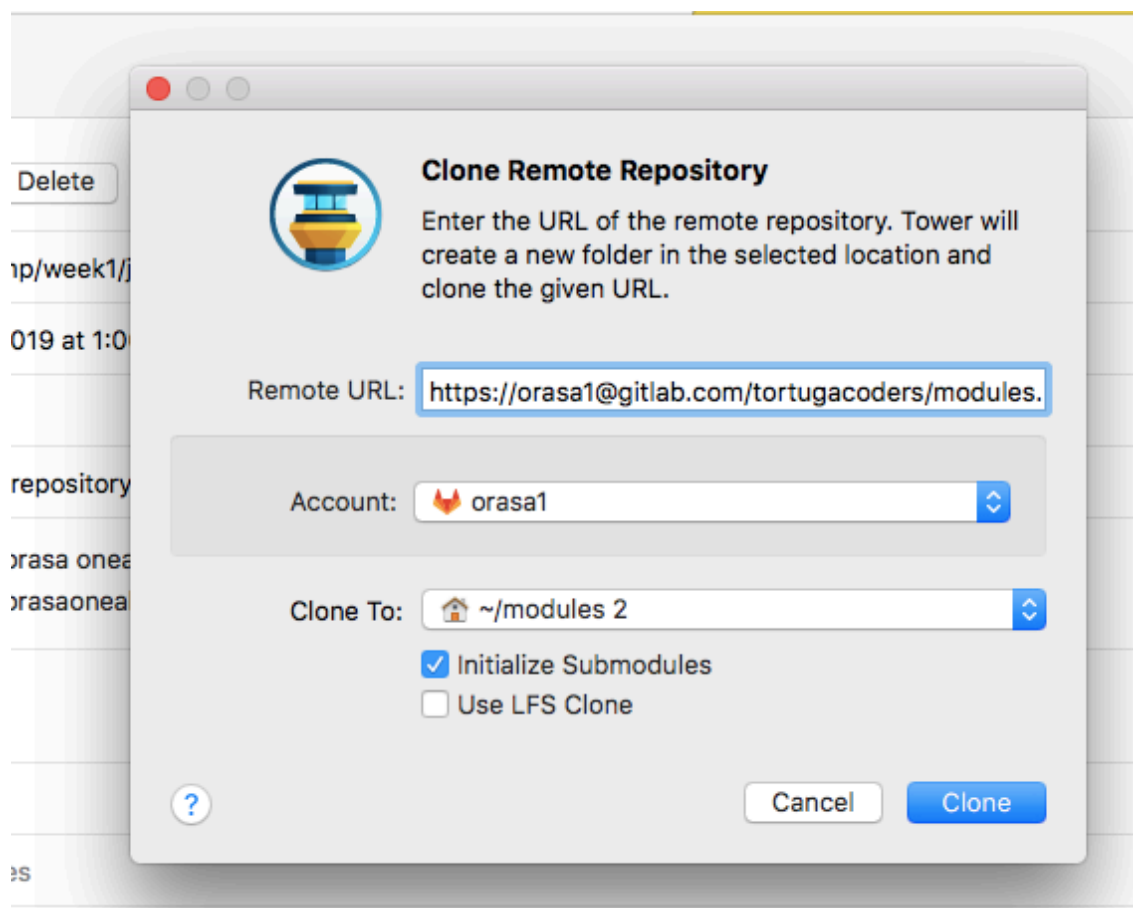

The screenshot shows the GitLab web interface for the 'modules' project. The 'Clone' button is clicked, showing a dropdown menu with 'Clone with SSH' and 'Clone with HTTPS' options. The 'Clone with HTTPS' option is selected, and the URL 'https://gitlab.com/tortugacoders/modules' is displayed. A tooltip 'Copy URL to clipboard' is visible next to the URL.

Name	Last commit	Last update
abc	abc game	1 day ago
functions.js	basic import export	1 day ago
index.js	basic import export	1 day ago
login.js	basic import export	1 day ago

Step 3. Go to your Git Tower. On Top Left corner, choose Repositories image. Find the dropdown Arrow with Plus sign(+) at the bottom left corner. Click open and choose Clone git repository.

Step 4. The window will show up. Paste the copy URL on the Remote URL button. Select your account, in this case GitLab. Select Clone button.

Step 5. On Tower. Go to Repositories. The new Repository folder should appear on the left. Now we can open and work on it.
